Abstract:

For a successful and predictable implant therapy in the esthetic zone we need to know that advantages and disadvantage of delayed versus immediate implant placement.

As a clinician you need to know the long-term prognoses of both treatment modalities, you need to know the limits and chances for the esthetic outcome and you need to know your personal limits in different clinical situations.

Based on complications of esthetic cases you will better understand how to make the right decisions for every individual case and to choose the right timepoint after tooth extraction.

Learning objectives:

- You will learn the advantages and disadvantages of immediate implants
- You will learn about the long-term outcome of immediate implants versus delayed implants in the esthetic zone
- You will understand how to make the right decisions for every individual case related to immediate versus delayed implant placement
